29 October 1952

On 29 October 1952, Wednesday, SI and H experimentation was carried on in Building 13, Room 20, with [redacted] by [redacted]

Since all of the subjects were new and had only had one previous session, it was decided to discuss again in general terms the subject of hypnosis and its relation to the [redacted]rogram. After this, routine experimentation began.

It was decided by [redacted] and the writer to demonstrate to each of the subjects in turn another technique of inducing hypnosis. This time the fixtation technique was agreed upon. All three x subjects were given slow induction an[redacted]as able to attain a good depth of hypnosis and responded very excellently to a simple post-hypnotic. [redacted] attained a fairly slight sleep condition and [redacted] was definitely disturbed by a routine post-hypnotic suggestion but did not quite complete this which indicated that the depth was not very deep in her case. [redacted] was not tried on a Post Hypnotic and her induction was the least successful although she did obtain a light sleep state. The evening concluded with a further discussion along general lines at about 9:00 PM.

[redacted]
